

# BACK TO PRACTICE

## **Icon<sup>®</sup> Caries Infiltrant**

The minimally invasive way to treat caries earlier and preserve teeth longer

Icon Caries Infiltration is the minimally invasive treatment that bridges the gap between prevention and restoration. The revolutionary resin blocks the progression of caries up to D1, providing a better solution to the old “wait-and-see” approach. It eliminates the potential need for future fillings and is completed in one quick visit, with no drilling or anesthesia.

**FACT**  
**1**

### **Minimally invasive procedure: no drilling**

The procedure doesn't require drilling, an evergrowing concern for both patients and dental professionals.

**FACT**  
**2**

### **No anesthesia required**

Patients will appreciate that there's no need for anesthesia, especially parents considering treatment for their children.

**FACT**  
**3**

### **Prevents the need for potential cavity fillings**

Healthy tooth structure is preserved as the resin effectively blocks the progression of early caries growth, reducing the need for a potential cavity filling or other, more invasive procedure.

**FACT**  
**4**

### **One visit limits patient interaction**

With a total treatment time of approx. 30 mins., patient interaction is limited, allowing more patients to be seen during one day.
